

**NATIONAL UNIVERSITY OF SCIENCE AND TECHNOLOGY
FACULTY OF ENGINEERING
DEPARTMENT OF ELECTRONIC ENGINEERING**

FINAL YEAR PROJECT REPORT

Project Title:

Student Name and number :

Supervisor (s):

Year (All above information is the cover page)

(These start from the second page and are numbered accordingly)

2.0 Declaration.

Dedication. Acknowledgements (these are optional and should be written in separate pages. It is normal to thank those who give given help and support during your project)

3.0 Abstract: (separate page)

Which outlines the essence of the research project in around 150–200 words. It describes the purpose and motivation for the study, and a statement of the problem, the data collection methodology and analysis, and the significant results and implications of the research.

4.0 Table of Contents:

Lists the sections of the Research Project (headings and indented sub-headings) and the corresponding page numbers.

5.0 Introduction:

Provides background information for the research (i.e. the problem being addressed) and is typically structured from general information to narrow or focused ideas; whereupon your research question/s are presented. A detailed system description and block diagram should be presented. Clearly mark the input and output of the system designed. Importance and the relevancy to Zimbabwe (if any) should be pointed out clearly. Avoid repeating the exact same sentence from the abstract.

6.0 Review of Literature

Review of Literature demonstrates that you know the field. This means more than reporting what you've read and understood. Instead, you need to read it critically and to write in such a way that shows you have a feel for the area; you know what the most important issues are and their relevance to your work, you know the controversies, you know what's neglected, you have the anticipation of where it's being taken. All this would allow you to map the field and position your research within the context.

It justifies the reason for your research. This is closely connected with demonstrating that you know the field. It is the knowledge of your field which allows you to identify the gap which your research could fill. However, it is not enough to find a gap. You have also to be able to convince your reader that what you are doing is important and needs to be done.

It allows you to establish your theoretical framework and methodological focus. Even if you are proposing a new theory or a new method, you are doing so in relation to what has been done.

The literature review becomes your springboard for the whole report.

7.0 Research Design or Methodology (Main body of the report)

It is a strategy that you choose to integrate the different components of the study in a coherent and logical way, thereby, ensuring you will effectively address the **research** problem; This includes a description and rationale for the methods of data collection and analysis, and the materials used when solving the problem. Typically, it uses subheadings (i.e. Subjects, Instrumentation, Data Collection, Methods of Analysis etc.) The linkage between chapters should be stated clearly at the beginning and/or the end of the chapter to show the relationship between chapters.

8.0 Results and discussion:

The following should be explained in this chapter: research findings, analysis, conclusion
Suggestions on the further improvements can be included

9. References and Bibliography

Referencing in the text and in the list of references must be totally accurate, complete and consistent. Electronic engineering uses the **IEEE** style .

Bibliography contains details of books, articles, etc that are not referenced directly in the text but read by the author and were used during the project as significant information source.

Final Document 100 pages on research text (from Chapter 1 to last reference page)

All reports must be checked for plagiarism using Turnitin software available at NUST .
